Background: This gene is a member of the cadherin superfamily. The gene product is

composed of five cadherin repeat domains and a cytoplasmic tail similar to the

highly conserved cytoplasmic region of classical cadherins. Expressed

predominantly in the brain, this putative calcium-dependent cell adhesion protein may play an important role in morphogenesis and tissue formation in neural and

non-neural cells during development and maintenance of the brain and

neuroendocrine organs. [provided by RefSeq, Jul 2008],

Function: function:Cadherins are calcium dependent cell adhesion proteins. They

preferentially interact with themselves in a homophilic manner in connecting cells; cadherins may thus contribute to the sorting of heterogeneous cell types. PB-cadherins may have a role in the morphological organization of pituitary gland and

brain tissues., similarity: Contains 5 cadherin domains.,
