Background : Messenger RNA stability and translation initiation are extensively under the control of poly(A)-binding proteins (PABP). See PABPC1 (MIM 604679) for background information.[supplied by OMIM, Jul 2002],

Function : function: Binds the poly(A) tail of mRNA. May be involved in cytoplasmic regulatory processes of mRNA metabolism. Binds poly(A) with a slightly lower affinity as compared to PABPC1., similarity: Belongs to the polyadenylate-binding protein type-1 family., similarity: Contains 1 PABC domain., similarity: Contains 4 RRM (RNA recognition motif) domains., tissue specificity: Testis specific.,

Subcellular Location : Cytoplasm .

Expression :

Testis specific.
