Background : STEAP2 metalloredutase(STEAP2) Homo sapiens This gene is a member of the STEAP family and encodes a multi-pass membrane protein that localizes to the Golgi complex, the plasma membrane, and the vesicular tubular structures in the cytosol. A highly similar protein in mouse has both ferrereductase and cupric reductase activity, and stimulates the cellular uptake of both iron and copper in vitro. Increased transcriptional expression of the human gene is associated with prostate cancer progression. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. [provided by RefSeq, Jul 2008],

Function : cofactor:FAD.,function:Metalloredutase that has the ability to reduce both Fe(3+) to Fe(2+) and Cu(2+) to Cu(1+). Uses NAD(+) as acceptor.,similarity:Belongs to the STEAP family.,similarity:Contains 1 ferric oxidoreductase domain.,tissue specificity:Expressed at high levels in prostate and at significantly lower levels in heart, brain, kidney, pancreas, and ovary.,

Subcellular Location : Endosome membrane ; Multi-pass membrane protein . Cell membrane ; Multi-pass membrane protein .

Expression : Expressed at high levels in prostate and at significantly lower levels in heart, brain, kidney, pancreas, and ovary.
