Background : Originally named because of its sequence similarity to the *Saccharomyces cerevisiae* NHP2 (non-histone protein 2), this protein appears to be a highly conserved nuclear protein that is a component of the [U4/U6.U5] tri-snRNP. It binds to the 5' stem-loop of U4 snRNA. Two transcript variants encoding the same protein have been found for this gene. [provided by RefSeq, Jul 2008],

Function : function: Binds to the 5'-stem-loop of U4 snRNA and may play a role in the late stage of spliceosome assembly. The protein undergoes a conformational change upon RNA-binding., similarity: Belongs to the ribosomal protein L7Ae family., subcellular location: Concentrated in the dense fibrillar component of the nucleolus., subunit: Interacts with RAD17., tissue specificity: Ubiquitous.,

Subcellular Location : Nucleus . Nucleus, nucleolus . Concentrated in the dense fibrillar component of the nucleolus. .

Expression : Ubiquitous.
