**Background :** This gene encodes a member of the thioredoxin superfamily. Members of this

family are characterized by a conserved active motif called the thioredoxin fold that catalyzes disulfide bond formation and isomerization. This protein localizes to the endoplasmic reticulum and has a single atypical active motif. The encoded protein is mainly involved in catalyzing native disulfide bond formation and displays activity similar to protein-disulfide isomerases. This protein may play a role in defense against endoplasmic reticulum stress. Alternate splicing results in

both coding and non-coding variants. [provided by RefSeq, Mar 2012],

Function: catalytic activity:2 glutathione + protein-disulfide = glutathione disulfide + protein-

dithiol.,cofactor:FAD.,function:Possesses significant protein thiol-disulfide oxidase activity.,function:Probable oxidoreductase that acts as a caspase-independent mitochondrial effector of apoptotic cell death. Extramitochondrial AIF induces nuclear chromatin condensation and large scale DNA fragmentation (in vitro). Binds to DNA in a sequence-independent manner.,similarity:Belongs to the FAD-

dependent oxidoreductase family., similarity: Contains 1 thioredoxin

domain., subcellular location: Translocated to the nucleus upon induction of apoptosis., subunit: Interacts with XIAP., tissue specificity: Widely expressed.,

Subcellular Location:

Endoplasmic reticulum lumen .

**Expression :** Widely expressed.
