Background: This gene encodes a member of the PAQR (progestin and adipoQ receptor)

family. Members of this family are evolutionarily conserved with significant sequence identity to bacterial hemolysin-like proteins and are defined by a set of seven transmembrane domains. The protein encoded by this gene localizes to the

Golgi apparatus to modulate Ras signaling. Alternative splicing results in multiple

transcript variants and protein isoforms. [provided by RefSeq, Jun 2012],

Golgi apparatus membrane ; Multi-pass membrane protein .

Expression: Shows restricted expression with highest levels in brain and testis.
