

PR (phospho Ser294) Polyclonal Antibody

Catalog No: YP0531

Reactivity: Human; Mouse; Rat

Applications: WB;IHC

Target: PR

Fields: >>Oocyte meiosis;>>Progesterone-mediated oocyte maturation;>>Estrogen

signaling pathway;>>Chemical carcinogenesis - receptor activation;>>Breast

cancer

P06401

Q00175

Gene Name: PGR

Protein Name: Progesterone receptor

Human Gene Id: 5241

Human Swiss Prot

No:

Mouse Swiss Prot

No:

Rat Gene ld: 25154

Rat Swiss Prot No: Q63449

Immunogen: The antiserum was produced against synthesized peptide derived from human

Progesterone Receptor around the phosphorylation site of Ser294. AA

range:261-310

Specificity: Phospho-PR (S294) Polyclonal Antibody detects endogenous levels of PR

protein only when phosphorylated at S294.

Formulation : Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Source: Polyclonal, Rabbit, IgG

Dilution: WB 1:500-2000;IHC 1:50-300

1/4

Purification: The antibody was affinity-purified from rabbit antiserum by affinity-

chromatography using epitope-specific immunogen.

Concentration: 1 mg/ml

Storage Stability: -15°C to -25°C/1 year(Do not lower than -25°C)

Observed Band: 98kD

Cell Pathway: Oocyte meiosis; Progesterone-mediated oocyte maturation;

Background : This gene encodes a member of the steroid receptor superfamily. The encoded

protein mediates the physiological effects of progesterone, which plays a central role in reproductive events associated with the establishment and maintenance of pregnancy. This gene uses two distinct promotors and translation start sites in the first exon to produce several transcript variants, both protein coding and non-protein coding. Two of the isoforms (A and B) are identical except for an additional 165 amino acids found in the N-terminus of isoform B and mediate their

own response genes and physiologic effects with little overlap. [provided by

RefSeq, Sep 2015],

Function: domain: Composed of three domains: a modulating N-terminal domain, a DNA-

binding domain and a C-terminal steroid-binding domain.,function:Isoform A is

inactive in stimulating c-Src/MAPK signaling on hormone

stimulation.,function:The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. Progesterone receptor isoform B (PRB) is involved

activation of c-SRC/MAPK signaling on hormone stimulation.,online

information:Progesterone receptor entry,PTM:Phosphorylated on multiple serine sites. Several of these sites are hormone-dependent. Phosphorylation on Ser-294 occurs preferentially on isoform B, is highly hormone-dependent and modulates ubiquitination and sumoylation on Lys-388. Phosphorylation on Ser-102 and Ser-345 also requires induction by hormone. Basal phosphorylation on Se

Subcellular Location:

Nucleus. Cytoplasm. Nucleoplasmic shuttling is both hormone- and cell cycle-dependent. On hormone stimulation, retained in the cytoplasm in the G(1) and G(2)/M phases.; [Isoform A]: Nucleus. Cytoplasm. Mainly nuclear.; [Isoform 4]:

Mitochondrion outer membrane.

Expression : In reproductive tissues the expression of isoform A and isoform B varies as a

consequence of developmental and hormonal status. Isoform A and isoform B are expressed in comparable levels in uterine glandular epithelium during the proliferative phase of the menstrual cycle. Expression of isoform B but not of isoform A persists in the glands during mid-secretory phase. In the stroma, isoform A is the predominant form throughout the cycle. Heterogeneous isoform expression between the glands of the endometrium basalis and functionalis is

implying region-specific responses to hormonal stimuli.
