Cell Pathway: Neuroactive ligand-receptor interaction;

Background: The gamma-aminobutyric acid (GABA) A receptor is a multisubunit chloride

channel that mediates the fastest inhibitory synaptic transmission in the central nervous system. This gene encodes GABA A receptor, beta 1 subunit. It is mapped to chromosome 4p12 in a cluster comprised of genes encoding alpha 4, alpha 2 and gamma 1 subunits of the GABA A receptor. Alteration of this gene is implicated in the pathogenetics of schizophrenia. [provided by RefSeq, Jul 2008],

Function: function:GABA, the major inhibitory neurotransmitter in the vertebrate brain.

mediates neuronal inhibition by binding to the GABA/benzodiazepine receptor and opening an integral chloride channel.,online information:Forbidden fruit - Issue 56 of March 2005,similarity:Belongs to the ligand-gated ionic channel (TC 1.A.9) family.,subunit:Binds UBQLN1 (By similarity). Generally pentameric. There

are five types of GABA(A) receptor chains: alpha, beta, gamma, delta, and rho.,
