**Cell Pathway:** Chemokine;Focal adhesion;Leukocyte transendothelial migration;Regulates

Actin and Cytoskeleton;

**Background:** BCAR1, or CAS, is an Src (MIM 190090) family kinase substrate involved in

various cellular events, including migration, survival, transformation, and invasion (Sawada et al., 2006 [PubMed 17129785]).[supplied by OMIM, May 2009],

Function: domain: A serine-rich region promotes activation of the serum response element

(SRE).,domain:Contains a central domain (substrate domain) containing multiple potential SH2-binding sites and a C-terminal domain containing a divergent helix-loop-helix (HLH) motif. The SH2-binding sites putatively bind CRK, NCK and ABL

SH2 domains. The HLH motif is absolutely required for the induction of pseudohyphal growth in yeast and mediates heterodimerization with

CASL.,domain:The SH3 domain is necessary for the localization of the protein to focal adhesions and interacts with one proline-rich region of focal adhesion kinase 1.,function:Docking protein which plays a central coordinating role for tyrosine-kinase-based signaling related to cell adhesion. Implicated in induction of cell migration. Overexpression confers antiestrogen resistance on breast cancer

cells.,PTM:Focal adhesion kinase 1 phosphoryl

**Subcellular** Cell junction, focal adhesion . Cytoplasm . Cell projection, axon .

Unphosphorylated form localizes in the cytoplasm (By similarity). Localizes to

focal adhesion sites following integrin engagement (By similarity)...

**Expression:** Widely expressed with an abundant expression in the testis. Low level of

expression seen in the liver, thymus, and peripheral blood leukocytes. The protein

has been detected in a B-cell line.
