**Cell Pathway:** Non-homologous end-joining;Cell\_Cycle\_G1S;Cell\_Cycle\_G2M\_DNA;

**Background:** This gene encodes the catalytic subunit of the DNA-dependent protein kinase

(DNA-PK). It functions with the Ku70/Ku80 heterodimer protein in DNA double strand break repair and recombination. The protein encoded is a member of the

PI3/PI4-kinase family.[provided by RefSeq, Jul 2010],

**Function:** catalytic activity:ATP + a protein = ADP + a phosphoprotein.,enzyme

regulation:Inhibited by wortmannin. Activity of the enzyme seems to be attenuated by autophosphorylation.,function:Serine/threonine-protein kinase that acts as a molecular sensor for DNA damage. Involved in DNA nonhomologous end joining (NHEJ) required for double-strand break (DSB) repair and V(D)J recombination. Must be bound to DNA to express its catalytic properties. Promotes processing of

hairpin DNA structures in V(D)J recombination by activation of the hairpin endonuclease artemis (DCLRE1C). The assembly of the DNA-PK complex at DNA ends is also required for the NHEJ ligation step. Required to protect and align broken ends of DNA. May also act as a scaffold protein to aid the

localization of DNA repair proteins to the site of damage. Found at the ends of

chromosomes, suggesting a further role in the maintenance of
