immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in
modulation of cellular responses. The phosphorylated ITIM motif can bind the
SH2 domain of several SH2-containing phosphatases., function: Putative adhesion
molecule of myelomonocytic-derived cells that mediates sialic-acid dependent
binding to cells. Preferentially binds to alpha-2,6-linked sialic acid. The sialic acid
recognition site may be masked by cis interactions with sialic acids on the same
cell surface. In the immune response, may act as an inhibitory receptor upon
ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s)
via their SH2 domain(s) that block signal transduction through dephosphorylation
of signaling molecules. Induces apoptosis in acute myeloid leukemia (in
vitro).,online information:Siglec-3,PTM:Phosphorylation of Tyr-340 is involved in
binding to PTPN6 and PTPN11. Phosphorylation of Tyr-358 is involved in binding
to PTPN6., similarity: Belongs to the immunoglobulin superfamily. SIGLEC (sialic
acid binding Ig-like lectin) family., similarity: Contains 1 Ig-like C2-type
(immunoglobulin-like) domain.,similarity:Contains 1 Ig-like V-type
(immunoglobulin-like) domain., subunit: Interacts with PTPN6/SHP-1 and
PTPN11/SHP-2 upon phosphorylation.,tissue specificity:Monocytic/myeloid
lineage cells.,

Subcellular Location :	[Isoform CD33M]: Cell membrane ; Single-pass type I membrane protein.; [Isoform CD33m]: Peroxisome . CD33m isoform does not localize to cell surfaces but instead accumulates in peroxisomes
Expression :	Monocytic/myeloid lineage cells. In the brain, CD33 is mainly expressed on microglial cells.
