

CD59 (PN0129) Nb-FC recombinant antibody

Catalog No: YA0417

Reactivity: Human

Applications: ELISA

Target: CD59

Gene Name: CD59 MIC11 MIN1 MIN2 MIN3 MSK21

Protein Name: CD59 glycoprotein (1F5 antigen) (20 kDa homologous restriction factor)

(HRF-20) (HRF20) (MAC-inhibitory protein) (MAC-IP) (MEM43 antigen)

(Membrane attack complex inhibition factor) (MACIF) (Membrane

Human Gene Id: 966

Human Swiss Prot

No:

Immunogen: Purified recombinant Human CD59

P13987

Specificity: This recombinant monoclonal antibody can detects endogenous levels of CD59

protein.

Formulation : Phosphate-buffered solution

Source: Camel, chimeric fusion of Nanobody (VHH) and mouse IgG1 Fc domain,

recombinantly produced from 293F cell

Dilution: ELISA 1:5000-100000

Purification: Recombinant Expression and Affinity purified

Concentration : Please check the information on the tube

Storage Stability: -15°C to -25°C/1 year(Avoid freeze / thaw cycles)

Cell Pathway: Complement and coagulation cascades; Hematopoietic cell lineage;

1/3

Background:

This gene encodes a cell surface glycoprotein that regulates complement-mediated cell lysis, and it is involved in lymphocyte signal transduction. This protein is a potent inhibitor of the complement membrane attack complex, whereby it binds complement C8 and/or C9 during the assembly of This complex, thereby inhibiting the incorporation of multiple copies of C9 into the complex, which is necessary for osmolytic pore formation. This protein also plays a role in signal transduction pathways in the activation of T cells. Mutations in This gene cause CD59 deficiency, a disease resulting in hemolytic anemia and thrombosis, and which causes cerebral infarction. Multiple alternatively spliced transcript variants, which encode the same protein, have been identified for This gene. [provided by RefSeq, Jul 2008]

Function:

disease:Defects in CD59 are the cause of CD59 deficiency [MIM:612300].,Potent inhibitor of the complement membrane attack complex (MAC) action. Acts by binding to the C8 and/or C9 complements of the assembling MAC, thereby preventing incorporation of the multiple copies of C9 required for complete formation of the osmolytic pore. This inhibitor appears to be species-specific. Involved in signal transduction for T-cell activation complexed to a protein tyrosine kinase.,The soluble form from urine retains its specific complement binding activity, but exhibits greatly reduced ability to inhibit MAC assembly on cell membranes.,online information:CD59 mutation db,PTM:Glycated. Glycation is found in diabetic subjects, but only at minimal levels in nondiabetic subjects. Glycated CD59 lacks MAC-inhibitory function and confers to vascular complications of diabetes.,PTM:N- and O-glycosylated. The

Subcellular Location:

Cell membrane; Lipid-anchor, GPI-anchor. Secreted. Soluble form found in a number of tissues.

Expression:

Blood, Colon, Heart, Milk, T-cell, Urine

Tag:

recombinant

Sort :

3625

No4:

1

Speciality:

Nanobody
