Background :	The protein encoded by this gene is a member of the MAP kinase family. MAP kinases, also known as extracellular signal-regulated kinases (ERKs), act in a
	signaling cascade that regulates various cellular processes such as proliferation,
	differentiation, and cell cycle progression in response to a variety of extracellular
	signals. This kinase is activated by upstream kinases, resulting in its translocation
	to the nucleus where it phosphorylates nuclear targets. Alternatively spliced
	transcript variants encoding different protein isoforms have been described. [provided by RefSeq, Jul 2008],
Function :	catalytic activity: ATP + a protein = ADP + a
Function:	phosphoprotein.,cofactor:Magnesium.,domain:The TXY motif contains the
	threonine and tyrosine residues whose phosphorylation activates the MAP
	kinases.,enzyme regulation:Activated by tyrosine phosphorylation in response to
	insulin and NGF., function: Involved in both the initiation and regulation of meiosis,
	mitosis, and postmitotic functions in differentiated cells by phosphorylating a
	number of transcription factors such as ELK-1. Phosphorylates EIF4EBP1; required for initiation of translation. Phosphorylates microtubule-associated
	protein 2 (MAP2). Phosphorylates SPZ1 (By similarity). Phosphorylates heat
	shock factor protein 4 (HSF4).,PTM:Dually phosphorylated on Thr-202 and
	Tyr-204, which activates the enzyme., similarity: Belongs to the protein kinase
	superfamily., similarity: Belongs to the protein kinase superfamily. CMGC Ser/Thr

Various whole cell lysates were separated by 4-20% SDS-PAGE, and the membrane was blotted with anti-ERK1/2 (PT0510R) antibody. The HRP-conjugated Goat anti-Rabbit IgG(H + L) antibody was used to detect the antibody.
