

A so selected as a local	O	E	
Andiotensin (Enzyme 1	∣mouse mAb
, anglotonom		Linzyinio i	

Catalog No: YM1270

Reactivity: Mouse

Applications: WB

Target: ACE

Fields: >>Renin-angiotensin system;>>Renin secretion;>>Chagas

disease;>>Coronavirus disease - COVID-19;>>Hypertrophic

cardiomyopathy;>>Diabetic cardiomyopathy

Gene Name: ace

Human Gene ld: 1636

Human Swiss Prot

No:

Mouse Swiss Prot

No:

Immunogen: Purified recombinant human Angiotensin Converting Enzyme 1 protein

fragments expressed in E.coli.

P12821

P09470

Specificity: This antibody detects endogenous levels of Angiotensin Converting Enzyme 1

and does not cross-react with related proteins.

Formulation: Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Source: Monoclonal, Mouse

Dilution: wb 1:1000

Purification: The antibody was affinity-purified from mouse ascites by affinity-

chromatography using epitope-specific immunogen.

Concentration: 1 mg/ml

Storage Stability: -15°C to -25°C/1 year(Do not lower than -25°C)

1/3

Observed Band: 190kD

Cell Pathway : Renin-angiotensin system; Hypertrophic cardiomyopathy (HCM);

Background: This gene encodes an enzyme involved in catalyzing the conversion of

angiotensin I into a physiologically active peptide angiotensin II. Angiotensin II is a potent vasopressor and aldosterone-stimulating peptide that controls blood pressure and fluid-electrolyte balance. This enzyme plays a key role in the reninangiotensin system. Many studies have associated the presence or absence of a 287 bp Alu repeat element in this gene with the levels of circulating enzyme or cardiovascular pathophysiologies. Multiple alternatively spliced transcript variants encoding different isoforms have been identified, and two most abundant spliced variants encode the somatic form and the testicular form, respectively, that are

equally active. [provided by RefSeq, May 2010],

Function: catalytic activity:Release of a C-terminal dipeptide, oligopeptide-|-Xaa-Yaa,

when Xaa is not Pro, and Yaa is neither Asp nor Glu. Thus, conversion of angiotensin I to angiotensin II, with increase in vasoconstrictor activity, but no action on angiotensin II.,cofactor:Binds 2 zinc ions per subunit. The Testis-specific isoform only binds 1 zinc ion per subunit.,cofactor:Binds 3 chloride ions per subunit.,disease:Defects in ACE are a cause of renal tubular dysgenesis (RTD) [MIM:267430]. RTD is an autosomal recessive severe disorder of renal tubular development characterized by persistent fetal anuria and perinatal death, probably due to pulmonary hypoplasia from early-onset oligohydramnios (the

Potter phenotype)., disease: Genetic variations in ACE could influence susceptibility to diabetic nephropathy [MIM:612624]; also called susceptibility to

microvascular complications of diabetes type 3

Subcellular [Angiotensin-converting enzyme, soluble form]: Secreted.; Cell membrane; Location: Single-pass type I membrane protein. Cytoplasm. Detected in both cell

membrane and cytoplasm in neurons. .

Expression: Ubiquitously expressed, with highest levels in lung, kidney, heart,

gastrointestinal system and prostate. Isoform Testis-specific is expressed in

spermatocytes and adult testis.

Sort: 2023

No4: 1

Host: Mouse

Modifications: Unmodified
