Background: The protein encoded by this gene is a mitogen that is secreted by vascular

endothelial cells. The encoded protein plays a role in chondrocyte proliferation and differentiation, cell adhesion in many cell types, and is related to platelet-derived growth factor. Certain polymorphisms in this gene have been linked with a

higher incidence of systemic sclerosis. [provided by RefSeq, Nov 2009],

Function: function:Major connective tissue mitoattractant secreted by vascular endothelial

cells. Promotes proliferation and differentiation of chondrocytes. Mediates

heparin- and divalent cation-dependent cell adhesion in many cell types including fibroblasts, myofibroblasts, endothelial and epithelial cells. Enhances fibroblast

growth factor-induced DNA synthesis., similarity: Belongs to the CCN family., similarity: Contains 1 CTCK (C-terminal cystine knot-like)

domain.,similarity:Contains 1 IGFBP N-terminal domain.,similarity:Contains 1 TSP type-1 domain.,similarity:Contains 1 VWFC domain.,subunit:Monomer.,

Subcellular Location:

Secreted, extracellular space, extracellular matrix. Secreted.

Expression: Expressed in bone marrow and thymic cells. Also expressed one of two Wilms

tumors tested.
