Cell Pathway : Glutathione metabolism;

Background : Glutamate-cysteine ligase, also known as gamma-glutamylcysteine synthetase,

is the first rate limiting enzyme of glutathione synthesis. The enzyme consists of two subunits, a heavy catalytic subunit and a light regulatory subunit. Gamma glutamylcysteine synthetase deficiency has been implicated in some forms of hemolytic anemia. Alternative splicing results in multiple transcript variants

encoding different isoforms. [provided by RefSeq, Apr 2015].

Function: pathway:Sulfur metabolism; glutathione biosynthesis; glutathione from L-

cysteine and L-glutamate: step 1/2.,similarity:Belongs to the aldo/keto reductase family. Glutamate--cysteine ligase light chain subfamily.,subunit:Heterodimer of a catalytic heavy chain and a regulatory light chain.,tissue specificity:In all tissues

examined. Highest levels in skeletal muscle.,

Subcellular

Location:

cytosol, glutamate-cysteine ligase complex,

Expression: In all tissues examined. Highest levels in skeletal muscle.
