Function: DNA/RNA-binding protein that plays a role in various cellular processes such as

transcription regulation, RNA splicing, RNA transport, DNA repair and damage response . Binds to nascent pre-mRNAs and acts as a molecular mediator between RNA polymerase II and U1 small nuclear ribonucleoprotein thereby coupling transcription and splicing . Binds also its own pre-mRNA and

autoregulates its expression; this autoregulation mechanism is mediated by non-sense-mediated decay. Plays a role in DNA repair mechanisms by promoting D-loop formation and homologous recombination during DNA double-strand break repair. In neuronal cells, plays crucial roles in dendritic spine formation and

stability, RNA transport, mRNA stability and synaptic homeostasis (By similarity).

Subcellular Location :

Nucleus . Displays a punctate pattern inside the nucleus and is excluded from

nucleoli...
