Background :	<p>Human influenza hemagglutinin (HA) is a surface glycoprotein required for the infectivity of the human virus. The HA tag is derived from the HA-molecule corresponding to amino acids 98-106 has been extensively used as a general epitope tag in expression vectors. Many recombinant proteins have been engineered to express the HA tag, which does not appear to interfere with the bioactivity or the biodistribution of the recombinant protein.</p>

Various whole cell lysates were separated by 4-20% SDS-PAGE, and the membrane was blotted with anti-HA-Tag (PT0523R) antibody. The HRP-conjugated Goat anti-Rabbit IgG(H + L) antibody was used to detect the antibody. Lane 1: HA-MBP(BL21) Predicted band size: 50kDa Observed band size: 55kDa
