**Cell Pathway :** MAPK\_ERK\_Growth;MAPK\_G\_Protein;

**Background :** The protein encoded by this gene is a member of the dual specificity protein

phosphatase subfamily. These phosphatases inactivate their target kinases by dephosphorylating both the phosphoserine/threonine and phosphotyrosine residues. They negatively regulate members of the mitogen-activated protein (MAP) kinase superfamily (MAPK/ERK, SAPK/JNK, p38), which are associated with cellular proliferation and differentiation. Different members of the family of dual specificity phosphatases show distinct substrate specificities for various MAP kinases, different tissue distribution and subcellular localization, and different modes of inducibility of their expression by extracellular stimuli. This gene product inactivates ERK1, ERK2 and JNK, is expressed in a variety of tissues, and is localized in the nucleus. Two alternatively spliced transcript

variants, encoding distinct isoforms, have been obser

**Function:** catalytic activity: A phosphoprotein + H(2)O = a protein + phosphate., catalytic

activity:Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate..function:Regulates mitogenic signal transduction by

dephosphorylating both Thr and Tyr residues on MAP kinases ERK1 and

ERK2., similarity: Belongs to the protein-tyrosine phosphatase family. Non-receptor

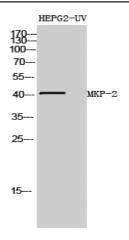

class dual specificity subfamily., similarity: Contains 1 rhodanese domain., similarity: Contains 1 tyrosine-protein phosphatase domain.,
