Background: function: Required for normal progress through mitosis. Involved in

cytokinesis., similarity: Belongs to the septin family., subcellular

location:Accumulates near the contractile ring from anaphase through telophase, and finally condenses into the midbody. In interphase and postmitotic cells, localised to fibrous or granular structures, depending on the growth state of the

cell., subunit: Monomer, and homodimer. Nucleotide binding promotes

dimerization. Heterohexamer composed of two heterotrimers containing one copy each of SEPT2, SEPT6 and SEPT7. The asymmetrical heterotrimers associate

head-to-head to form a hexameric unit that assembles into filaments.,

Chromosome, centromere, kinetochore. Cleavage furrow. Midbody. Cytoplasm, cell cortex. Cell projection, cilium membrane. Cell projection, cilium, flagellum. In metaphase cells, localized within the microtubule spindle. At the metaphase plate,

in close apposition to the kinetochores of the congressed chromosomes. In cells undergoing cytokinesis, localized to the midbody, the ingressing cleavage furrow, and the central spindle. During bacterial infection, displays a collar shape structure next to actin at the pole of invading bacteria. In epithelial cells,

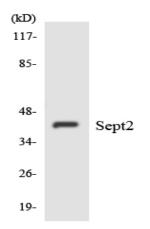

colocalizes with polyglutamylated tubulin around the trans-Golgi network, as well as juxatnuclear and proximal Golgi apparatus. Localizes at the base of the cil

Expression: Widely expressed. Up-regulated in liver cancer.
