**Background :** This gene encodes a retinoic acid-responsive protein. A homologous protein in mouse has been shown to be involved in the regulation of meiotic initiation in both spermatogenesis and oogenesis, though feature differences between the mouse and human proteins suggest that these homologs are not entirely functionally equivalent. It is thought that this gene may play a role in spermatogenesis in humans. [provided by RefSeq, Nov 2010],

**Function :** function:Required for the transition into meiosis for both female and male germ cells. In female germ cells, required for premeiotic DNA replication and subsequent events in meiotic prophase.,PTM:Phosphorylated.,tissue specificity:Expressed specifically in testis.,

**Subcellular Location :** Cytoplasm . Nucleus . Shuttles between nucleus and cytoplasm. Nuclear export is XPO1-dependent. .

**Expression :** Expressed specifically in testis and fetal ovaries.
