Cell Pathway: Cell adhesion molecules (CAMs);

Background: The protein encoded by this gene is a type I membrane protein and member of

the immunoglobulin superfamily. It is thought to be involved in the process of myelination. It is a lectin that binds to sialylated glycoconjugates and mediates certain myelin-neuron cell-cell interactions. Three alternatively spliced transcripts encoding different isoforms have been described for this gene. [provided by

Function: function:Adhesion molecule in postnatal neural development that mediates sialic-

acid dependent cell-cell interactions between neuronal and myelinating cells.

(immunoglobulin-like) domains., subunit: Binds to RTN4R.,

Subcellular Location:

Cell membrane; Single-pass type I membrane protein. Membrane raft.

Expression:

Both isoform 1 and isoform 2 are detected in myelinated structures in the central and peripheral nervous system, in periaxonal myelin and at Schmidt-Lanterman incisures (PubMed:9495552, PubMed:6200494). Detected in optic nerve, in oligodendroglia and in periaxonal myelin sheaths (PubMed:6200494). Detected in compact myelin (at protein level) (PubMed:6200494). Both isoform 1 and isoform 2 are detected in the central and peripheral nervous system (PubMed:9495552).
