Observed Band: 40kD

Cell Pathway: TGF-beta;

Background : This gene encodes a secreted ligand of the TGF-beta (transforming growth

factor-beta) superfamily of proteins. Ligands of this family bind various TGF-beta receptors leading to recruitment and activation of SMAD family transcription

factors that regulate gene expression. The encoded preproprotein is

proteolytically processed to generate the mature protein, which plays a role in leftright asymmetry determination of organ systems during development. This gene is closely linked to both a related family member and a related pseudogene.

[provided by RefSeq, Aug 2016],

Function: function:Required for left-right axis determination as a regulator of LEFTY2 and

NODAL.,PTM:The processing of the protein may also occur at the second R-X-X-R site located at AA 132-135. Processing appears to be regulated in a cell-type

specific manner., similarity: Belongs to the TGF-beta family.,

Subcellular

Location:

Expression: Colon, Pancreas, Spleen, Teratocarcinoma,

Secreted.
