

CD158e Polyclonal Antibody

Catalog No: YT5716

Reactivity: Human; Rat; Mouse;

Applications: WB;IHC;IF;ELISA

Target: CD158e

Fields: >>Antigen processing and presentation;>>Natural killer cell mediated

cytotoxicity;>>Graft-versus-host disease

Gene Name: KIR3DL1

Protein Name: Killer cell immunoglobulin-like receptor 3DL1

Human Gene Id: 3811

Human Swiss Prot P43629

No:

Mouse Swiss Prot

No:

Rat Gene Id: 353253

Rat Swiss Prot No: P83556

Immunogen: Synthesized peptide derived from Killer cell immunoglobulin-like receptor 3DL1

at AA range: 21-70

P83555

Specificity: CD158e Polyclonal Antibody detects endogenous levels of CD158e protein.

Formulation : Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Source: Polyclonal, Rabbit, IgG

Dilution: WB 1:500 - 1:2000. IHC: 1:100-1:300. ELISA: 1:10000.. IF 1:50-200

Purification: The antibody was affinity-purified from rabbit antiserum by affinity-

chromatography using epitope-specific immunogen.

1/3

Concentration: 1 mg/ml

Storage Stability: -15°C to -25°C/1 year(Do not lower than -25°C)

Observed Band: 50kD

Cell Pathway: Antigen processing and presentation; Natural killer cell mediated

cytotoxicity; Graft-versus-host disease;

Background: killer cell immunoglobulin like receptor, three lg domains and long cytoplasmic

tail 1(KIR3DL1) Homo sapiens Killer cell immunoglobulin-like receptors (KIRs) are transmembrane glycoproteins expressed by natural killer cells and subsets of T cells. The KIR genes are polymorphic and highly homologous and they are found in a cluster on chromosome 19q13.4 within the 1 Mb leukocyte receptor complex (LRC). The gene content of the KIR gene cluster varies among haplotypes, although several "framework" genes are found in all haplotypes (KIR3DL3, KIR3DP1, KIR3DL4, KIR3DL2). The KIR proteins are classified by the number of extracellular immunoglobulin domains (2D or 3D) and by whether they have a long (L) or short (S) cytoplasmic domain. KIR proteins with the long cytoplasmic domain transduce inhibitory signals upon ligand binding via an immune tyrosine-based inhibitory motif (ITIM), while KIR proteins with the short

cytoplasmic domain lack the

Function: function:Receptor on natural killer (NK) cells for HLA Bw4 allele. Inhibits the

activity of NK cells thus preventing cell lysis.,function:Receptor on natural killer

(NK) cells for HLA-C alleles. Does not inhibit the activity of NK

cells.,polymorphism:The KIR genes are located in a segment of DNA on 19q13.4 in the leukocyte receptor complex that has undergone expansion and contraction over time, probably through unequal crossing-over. Thus, KIR haplotypes vary in the number and types of genes, although a few framework loci, such as the gene KIR3DL1, are present on all or nearly all haplotypes. KIR3DL1 and KIR3DS1 segregate as alleles of the locus KIR3DL1/3DS1.,similarity:Belongs to the

immunoglobulin superfamily., similarity: Contains 3 Ig-like C2-type

(immunoglobulin-like) domains.,tissue specificity: Expressed in NK and T-cell lines

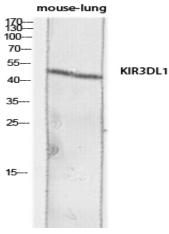

but not in B-lymphoblastoid cell lines or in a colon carc

Subcellular Location:

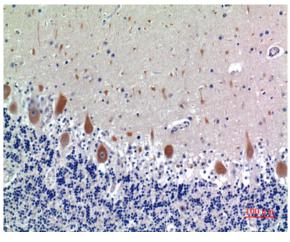

Cell membrane; Single-pass type I membrane protein.

Expression : Blood,Brain,Lymphoi
