Background : The protein encoded by this gene is found primarily in cerebellar Purkinje cells, where it functions as a protein phosphatase inhibitor. The encoded protein is a substrate for cGMP-dependent protein kinase. An allele of this gene was discovered that increases susceptibility to hypercholesterolemia. Two transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Jul 2010],

Function : function:Inhibits protein phosphatase-2A and protein phosphatase-1.,PTM:Substrate for cGMP-dependent protein kinase.,tissue specificity:Highly expressed in cerebellum.,

Subcellular Location : intracellular,

Expression : Highly expressed in cerebellum.
