Background: The protein encoded by this gene is a transmembrane glycoprotein that is a

member of the protein kinase superfamily. This protein is a receptor for members of the epidermal growth factor family. EGFR is a cell surface protein that binds to epidermal growth factor. Binding of the protein to a ligand induces receptor dimerization and tyrosine autophosphorylation and leads to cell proliferation. Mutations in this gene are associated with lung cancer. 2016],

Function: catalytic activity:ATP + a [protein]-L-tyrosine = ADP + a [protein]-L-tyrosine

phosphate., disease: Defects in EGFR are associated with lung cancer [MIM:211980]., function: Isoform 2/truncated isoform may act as an

antagonist., function: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GP30 and vaccinia virus growth factor. Is involved in the control of cell

increases the interaction of MUC1 with C-SRC and CTNNB1/beta-

catenin.,miscellaneous:Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complex, induction of the tyrosine kinase

growth and differentiation. Phosphorylates MUC1 in breast cancer cells and

activity, stimulation of cell DNA synthesis, and cell proliferation., online
