Background : This gene encodes a major subunit of the RAL-GTPase activating protein. A similar protein in mouse binds E12, a transcriptional regulator of immunoglobulin genes. The mouse protein also functions in skeletal muscle by binding to the regulatory 14-3-3 proteins upon stimulation with insulin or muscle contraction. A pseudogene of this gene has been identified on chromosome 9. [provided by RefSeq, Oct 2016],

Function : regulation of small GTPase mediated signal transduction,

Subcellular Location : Cytoplasm . Nucleus . Translocated to the nucleus, when associated with TCF3/E12. .

Expression : Widely expressed.
