Background: leukocyte receptor tyrosine kinase(LTK) Homo sapiens The protein encoded by

this gene is a member of the ros/insulin receptor family of tyrosine kinases. Tyrosine-specific phosphorylation of proteins is a key to the control of diverse pathways leading to cell growth and differentiation. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq,

Oct 2008],

Function: alternative products:Additional isoforms seem to exist, catalytic activity:ATP + a

[protein]-L-tyrosine = ADP + a [protein]-L-tyrosine phosphate.,function:The exact function of this protein is not known. It is probably a receptor with a tyrosine-protein kinase activity.,similarity:Belongs to the protein kinase superfamily. Tyr protein kinase family. Insulin receptor subfamily.,similarity:Contains 1 protein kinase domain.,tissue specificity:Expressed in non-hematopoietic cell lines and T-

and B-cell lines.,

Subcellular Location:

Cell membrane ; Single-pass type I membrane protein .

Expression: Expressed in non-hematopoietic cell lines and T- and B-cell lines.
