Cell Pathway: Antigen processing and presentation; NOD-like receptor; Progesterone-mediated

oocyte maturation; Pathways in cancer; Prostate cancer;

Background: The protein encoded by this gene is an inducible molecular chaperone that

functions as a homodimer. The encoded protein aids in the proper folding of specific target proteins by use of an ATPase activity that is modulated by co-chaperones. Two transcript variants encoding different isoforms have been found

for this gene. [provided by RefSeq, Jan 2012],

Function: caution:Despite classification as a pseudogene, the existence of this protein is

supported by unambiguous mass spectrometry evidence.,function:Molecular

chaperone.,function:Molecular chaperone. Has ATPase

activity., similarity: Belongs to the heat shock protein 90 family., subcellular

location:Identified by mass spectrometry in melanosome fractions from stage I to stage IV.,subunit:Homodimer. Interacts with AHSA1, SMYD3 and TOM34.

Interacts with FNIP1 and HSF1.,

Subcellular Nucleus . Cytoplasm . Melanosome . Cell membrane . Mitochondrion . Identified
