

## **NQO1 Polyclonal Antibody**

YT3186 Catalog No:

Reactivity: Human;Rat;Mouse;

**Applications:** WB;IF;ELISA

Target: NQO1

Fields: >>Ubiquinone and other terpenoid-quinone biosynthesis;>>Metabolic

> pathways:>>Biosynthesis of cofactors:>>Pathways in cancer:>>Chemical carcinogenesis - reactive oxygen species;>>Hepatocellular carcinoma;>>Fluid

shear stress and atherosclerosis

Gene Name: NQO1

**Protein Name:** NAD(P)H dehydrogenase [quinone] 1

P15559

Q64669

**Human Gene Id:** 1728

**Human Swiss Prot** 

No:

**Mouse Swiss Prot** 

No:

Immunogen:

The antiserum was produced against synthesized peptide derived from human

NQO1. AA range:203-252

NQO1 Polyclonal Antibody detects endogenous levels of NQO1 protein. **Specificity:** 

**Formulation:** Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Polyclonal, Rabbit, IgG Source:

**Dilution:** WB 1:500 - 1:2000. IF 1:50-200 ELISA: 1:10000. Not yet tested in other

applications.

**Purification:** The antibody was affinity-purified from rabbit antiserum by affinity-

chromatography using epitope-specific immunogen.

Concentration: 1 mg/ml

Storage Stability: -15°C to -25°C/1 year(Do not lower than -25°C)

Observed Band: 31kD

**Background:** This gene is a member of the NAD(P)H dehydrogenase (quinone) family and

encodes a cytoplasmic 2-electron reductase. This FAD-binding protein forms homodimers and reduces quinones to hydroquinones. This protein's enzymatic activity prevents the one electron reduction of quinones that results in the production of radical species. Mutations in this gene have been associated with tardive dyskinesia (TD), an increased risk of hematotoxicity after exposure to benzene, and susceptibility to various forms of cancer. Altered expression of this

protein has been seen in many tumors and is also associated with Alzheimer's disease (AD). Alternate transcriptional splice variants, encoding different isoforms, have been characterized. [provided by RefSeq, Jul

2008],

**Function:** catalytic activity:NAD(P)H + a quinone = NAD(P)(+) + a

hydroquinone.,cofactor:FAD.,enzyme regulation:Inhibited by

dicoumarol., function: The enzyme apparently serves as a quinone reductase in connection with conjugation reactions of hydroquinons involved in detoxification pathways as well as in biosynthetic processes such as the vitamin K-dependent

gamma-carboxylation of glutamate residues in prothrombin

synthesis.,induction:By dioxin.,mass spectrometry:

PubMed:11735396,miscellaneous:Quinone reductase accepts electrons from both NADH and NADPH with equal efficiency,,polymorphism:The Ser-187

polymorphism may be linked to susceptibility to forms of

cancers., similarity: Belongs to the NAD(P)H dehydrogenase (quinone)

family., subunit: Homodimer.,

Subcellular Location:

Cytoplasm, cytosol.

**Expression:** 

Colon, Liver, Pooled,
