**Background:** Phosphatidylinositol 3-kinase (PI3K) phosphorylates phosphatidylinositol and

similar compounds, which then serve as second messengers in growth signaling pathways. PI3K is composed of a catalytic and a regulatory subunit. The protein encoded by this gene represents a regulatory subunit of PI3K. The encoded protein contains two SH2 domains through which it binds activated protein tyrosine kinases to regulate their activity. [provided by RefSeq, Jun 2016],

**Function:** function:Binds to activated (phosphorylated) protein-tyrosine kinases through its

SH2 domain and regulates their kinase activity. During insulin stimulation, it also

binds to IRS-1., similarity: Belongs to the PI3K p85 subunit

family.,similarity:Contains 2 SH2 domains.,subunit:Heterodimer of a p110 (catalytic) and a p55 (regulatory) subunits.,tissue specificity:Highest levels in brain and testis. Lower levels in adipose tissue, kidney, heart, lung and skeletal

muscle.,

Subcellular Location :

<u>cyto</u>

cytosol, phosphatidylinositol 3-kinase complex,

**Expression:** Highest levels in brain and testis. Lower levels in adipose tissue, kidney, heart,

lung and skeletal muscle.
